

TASK 1 – TryHackMe

I have completed Crack-The-Hash in TryHackMe.

I love that site so much that it gives you hands-on practice.

I have faced some issues doing that.

I am currently using my 4GB RAM laptop. So it's a little bit difficult for me to run Kali-linux on my laptop.

So I have used termex to avoid that issue.

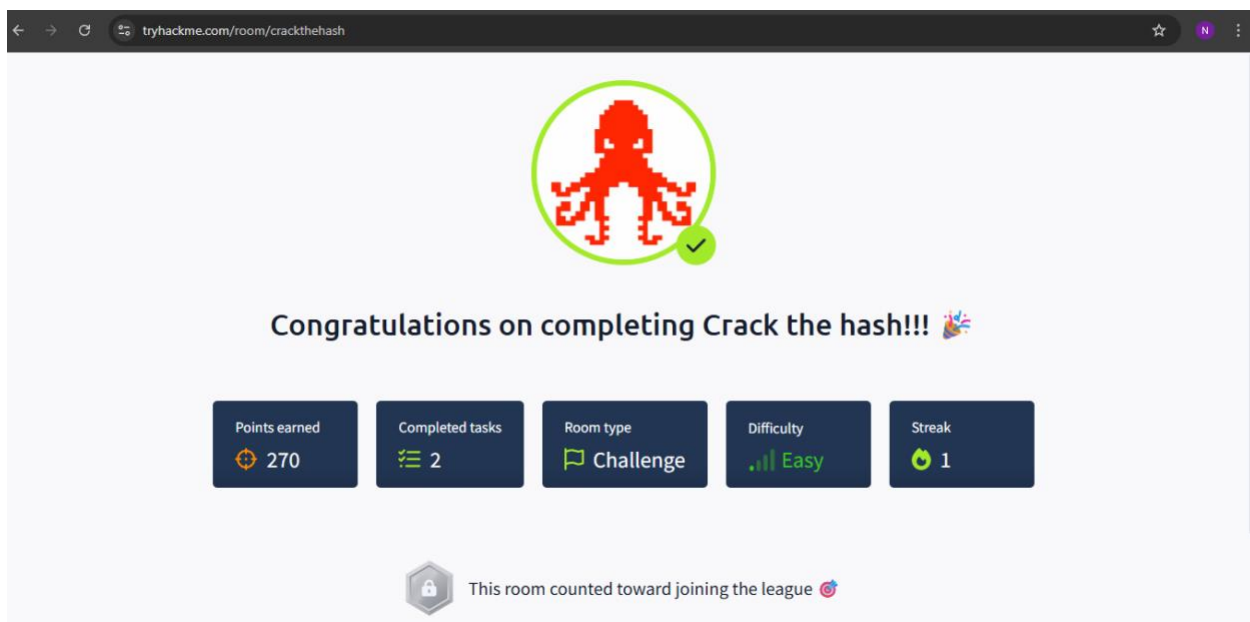

Also I have used some help from other sites like Hashes.com and CyberChef.

But I want to say that CyberChef didn't help me anything. It was so lagging and I waited for around 30mins for that. Then I stopped.

That's when I installed Termex on my phone.

I have used an open source git file for cracking the hash.

I got it from my 5-day internship course provided by Qnayds.

This is the reward I got from doing the Crack-the-hash.

Steps I followed:

1. Installed Termux (I can't run it on kali because of my laptop having low RAM)
2. Clone an open source file provided by my internship course.
3. Copy the encrypted passwords provided in the crack-the-hash room and saved it in a file.
4. Used Hashes.com for understanding the hash type.
5. Used help command to understand the hash code (-m)
6. Used command "hashcat -a 0 -m //hashcode //the file where passwords are stored //that cloned file".
7. After waiting some time we will get the decrypted password.
8. Copy and paste that in the crack-the-hash room.
9. Submit it

Continue this process until we finish that room.

It was really a simple process until I encountered the last two encrypted passwords.

It was salted hashes. So it was a bit difficult to understand it's hash code. I got it wrong 2 times.

But eventually I got it.

I was so happy that I finished my first task of this Bootcamp.

Really excited to see next tasks in the coming weeks.
